

# OrderWise Mobile WMS Devices

Businesses are always looking to improve warehouse operations, ensuring daily processes are kept streamlined,

accurate stock levels are maintained and orders quickly fulfilled. With barcode scanning technology an integral part of effective warehouse operations, here at OrderWise we are leading the way with our hugely popular Mobile WMS Devices.

## Mobile Warehouse Management

The OrderWise Mobile Warehouse Management (WMS) Device works wirelessly in conjunction with the main OrderWise system. Ultra-modern software is combined with cutting edge technology to provide the perfect partnership for fast paced warehouse operations.

## Fast & Accurate Picking

Achieving complete pick accuracy reduces dealing with costly returns, provides a high level of customer satisfaction and eliminates issues arising from stock discrepancies. Mobile WMS Devices integrate seamlessly with OrderWise Despatch to help achieve 100% picking accuracy whilst providing a more efficient way of working for increased productivity.

Removing the need for paper notes, picks are sent straight to a user's device with options to amalgamate picks if required. On screen prompts guide pickers by the best walk route while barcode scanning validates picks, with options to scan bin locations along with batch and serial numbers. Completed picks can then be sent wirelessly for pack and ship or auto-shipped from the device.

## Key Facts

- PDA Barcode Scanner
- Lightweight & Rugged
- Wi-Fi & 3G Enabled
- Works Online & Offline
- Accurate & Efficient
- Mobile Picking
- Process Goods In & Stock Takes
- GS1 Barcode Compatibility
- Warehouse Management
- Increase Productivity

“OrderWise has really helped us, providing a high level of automation within the warehouse and enabling us to cater for more demand.”

A.Perry & Co. (Hinges) Ltd

## Automated Pick Creation

OrderWise Pick Rules functionality allows picks to be automatically created based on a wide range of criteria. Group all single line orders for the same item into a pick, all orders from a specific sales channel or orders with stock in the same aisle. Pick Rule management can then link pickers to each rule e.g. heavy picks to a forklift picker.

## Goods In & Put Away

Provide an efficient, accurate and flexible way for your staff to book goods in to your warehouse. With the Mobile WMS Device Goods In module, staff scan received stock in against the relevant purchase order for fast and accurate goods receipt. Delivery note numbers, expiry dates, bin storage locations and the quantity received as well as the ability to scan batch or serial numbers if required can all be handled. Container Goods In then enables efficient container stock receipt while stock

received from transfers via the Stock Transfers module can also be booked in on these devices.

For greater efficiency following goods receipt, Mobile Put Away provides a structured and highly productive method of placing stock in to the right bin location in the warehouse ready for picking. Stock can be scanned onto a trolley or into totes and users will be directed using the best walk routes to the required bins, ensuring traceability details and quarantine issues are also accurately handled.

# Key Features of OrderWise Mobile WMS Devices

## Stock & Pick Face Replenishment

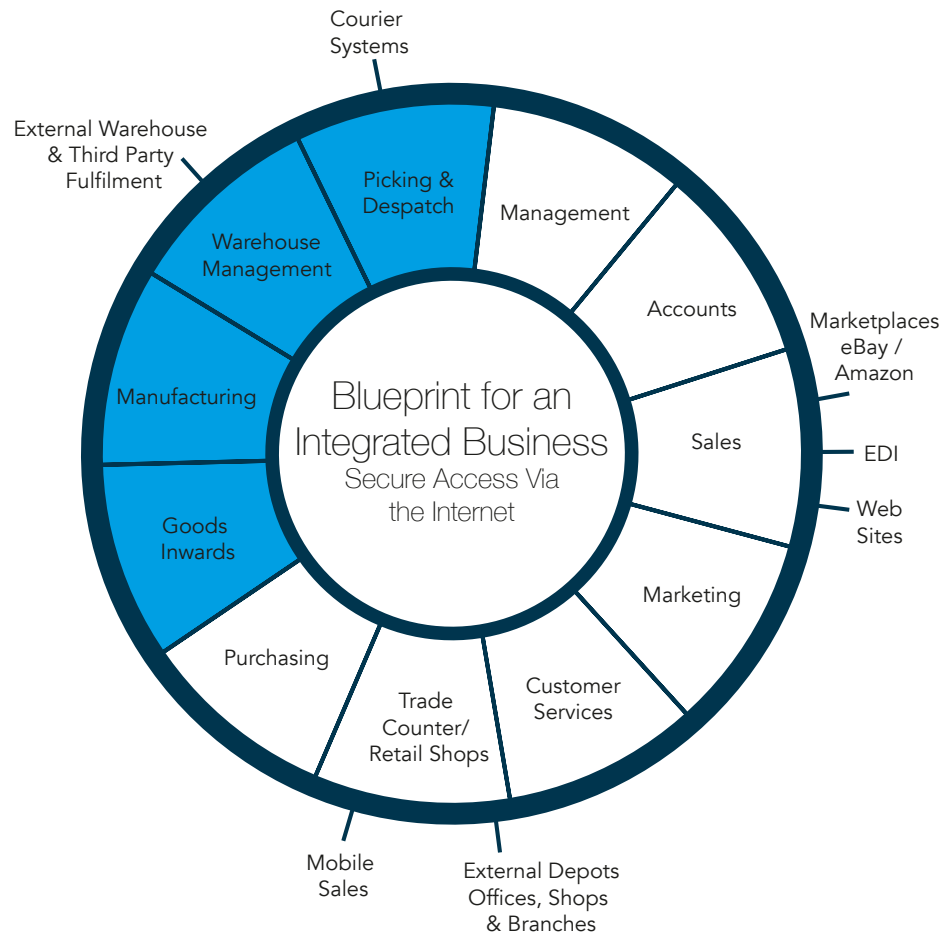

As stock is depleted from a main picking bin, staff end up travelling further or additional work is required to pick available stock, leading to significantly reduced picking speeds. Users with the Stock Replenishment module on the main system can perform structured management of pick face and bin replenishment via the mobile devices. Replenishments are wirelessly synced to a user's device and pickers are guided firstly to pick the required stock by best route before replenishing into relevant bins. Stock transformations required to complete any replenishments are seamlessly handled on the Mobile Warehouse Device as part of the process.

## Stock Take

Annual or rolling stock takes are a necessity for every business and the OrderWise main application has a host of features to help businesses meet their stock take requirements accurately and efficiently with as little disruption

## Key Features Include

- Picking, Tote Picking & Despatch
- Despatch at Point of Goods In
- Goods In & Put Away
- Container Goods In Management
- Kitted Item Handling
- Full & Partial Stock Take
- Manage Stock Discrepancies
- Stock Replenishments including Stock Transformation Requirements
- Stock Movements & Adjustments
- Picking Timers & Performance Stats
- GS1 Barcode Compatibility
- Scan Product, Bin, Batch & Serial Barcodes
- Guide Staff By Best Walk Route For Increased Speed & Productivity
- Works Seamlessly As Users Pass Through Areas of Wi Fi or 3G Connectivity
- Mobile Sales & Manufacturing
- Range of Accessories Available

as possible. By removing the paper trail and rekeying of information along with adding barcode validation, the Mobile Warehouse Device provides an even faster, more flexible tool for managing stock takes. Users can have either the entire stock take or part of it sent to their device with updates being sent back wirelessly to the main system.

## Mobile Manufacturing

The OrderWise Mobile Manufacturing module enables businesses to strike the perfect balance between efficient works order processing and detailed recording of manufacturing costs. By using OrderWise Mobile WMS Devices in-conjunction with Manufacturing in the main OrderWise system, businesses have the functionality available to pick component stock, work through manufacturing processes, manage sub contract work, log labour, equipment, add any created by-products and much more.

## GS1 Barcode Support

GS1 barcodes are already widely used in the food and pharmaceutical industries but are quickly becoming increasingly common in other businesses due to the huge efficiency benefits they offer. OrderWise Mobile WMS Devices fully support these dynamic barcodes which enable an item's EAN code, serial/batch number, expiry date and quantity to be recorded with just a single scan.

## Additional Warehouse Features

OrderWise Mobile WMS Devices also allow picker performance to be monitored with statistics sent back to the main system. A countdown timer can also be activated telling the picker how long they have to reach their next bin to ensure consistent pick rates.

By using OrderWise Mobile WMS Devices, your business can benefit from completely paperless warehouse management in the palm of your hand.
