

Standardised Data and Patient safety:

From 1979 to 2019 to 2039?

Professor Sir Terence Stephenson

Nuffield Professor, Institute of Child Health, University College London

Hon Cons UCLH & Great Ormond Street Hospital, London

Former Chair of GMC 2015-18

Past-President Royal College of Paediatrics & Child Health 2009-12

Standardised Data and Patient safety

- I joined the GS1 Advisory board in 2015 – my advice was to engage clinicians and see an evidence base
- My third time here – huge advances already. See the ‘TechTalks’ tomorrow
- Previously I have spoken about how the NHS should be thinking like a high risk industry
- Today I want to talk about standardised data

Where were we with data in 1979?

Where are we with data in 2019?

Data – we are surrounded by it and the UK NHS is awash with it

- Cancer registries
- Immunisation records
- Emails
- 100,000 genome project
- 3D MRI = 150 Mb
- Electronic health records

“In God we trust; all others bring data.”

– W. Edwards Deming

Will 'Big Data' answer all our health questions?

- By 2020, the average UK hospital will generate 1000 terabytes/year
- 50 petabytes of healthcare data stored currently
- 90% of the world's data generated in the last 2 years
- Exponential increase since internet 1989 and subsequent email, text, apps and other cyber data

What will Big Data be used for?

- Support research
- Support self care
- Support providers

BUT to do this we need to transform unstructured data into useful information

World's 5 biggest companies all use Big Data

- Amazon
- Apple
- Microsoft
- Facebook

Machines faster than humans at diagnosing brain injuries

Tom Whipple Science Editor

Computers have outperformed doctors in diagnosing neurological illnesses and retinal disease — a finding that scientists said could speed up treatments.

In two separate studies, artificial intelligence programs were trained to spot the signs of illness in CT scans. They did it as well as humans and were 100 times faster.

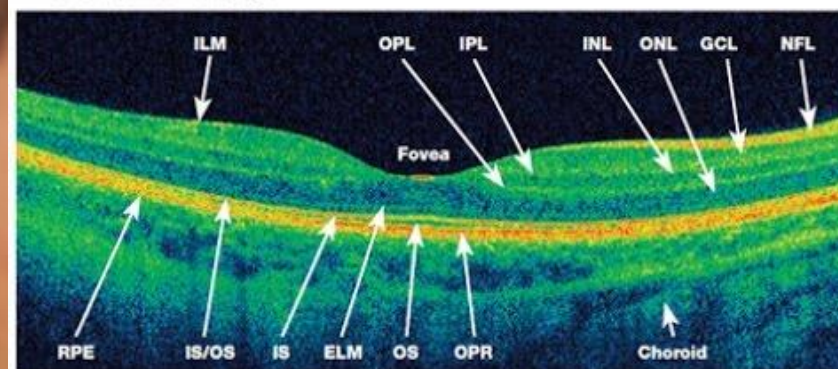

Scientists said this meant dangerous conditions could be spotted far more quickly. Eric Oermann, from Icahn School of Medicine at Mount Sinai, said: "With a total processing and interpretation time of 1.2 seconds, such a triage system can alert physicians to a critical finding that may otherwise re-

humans in a simulation. The research attention was not to flag up worrying scans they did not sit in a critically minute.

"The expression of the machine identifies that rapid response treatment of acute brain injuries, so any tools that diagnosis may lead to better outcomes," Joshua Mount Sinai Health.

In a separate study, a British team from Imperial College London, using computer programs to analyse brain scans, found that machines were 100 times faster than humans in a simulation.

TELE-EMERGENCY IN THE HIMALAYAS

Due to high altitude (14,000 feet above sea level), rugged terrain and extremely cold winters, the Himalayan mountains can be almost impossible to reach, making it challenging to provide essential services to this region.

Apollo's Himachal Pradesh TeleHealth program offers much-needed emergency, primary and speciality consultation services to these locations.

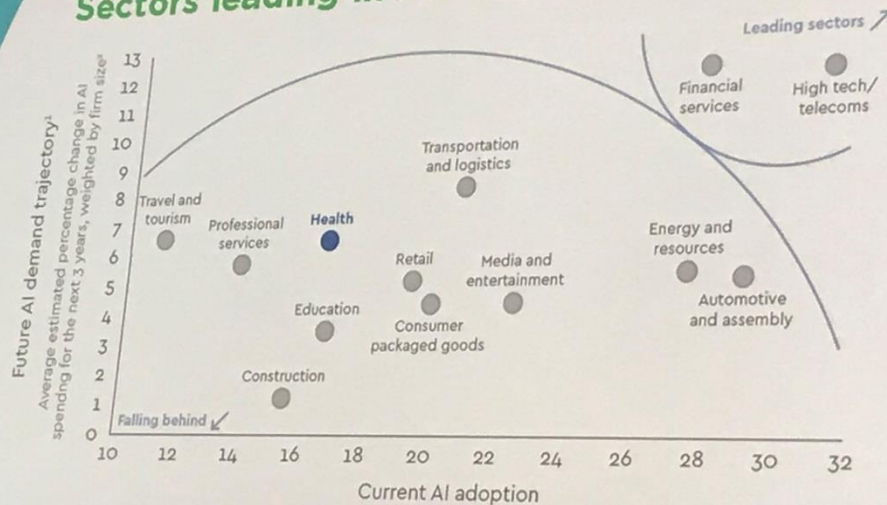

11,304

teleconsultations have been
provided under the project till

Sectors leading in AI adoption today

SOURCE: McKinsey Global Institute, AI adoption and use survey

The increasing availability of data and decreasing costs of data storage, processing and analysis create a unique opportunity to advance data science & AI in health

Where will we be with data in 2039?

There will be huge change – as there has been since 1979

Population

- Age
- Births
- Social isolation
- Loss of the nuclear family
- obesity

Technology

- Genomics
- Nanotechnology
- Artificial intelligence
- Robotics
- Online medicine
- Data

Disease patterns

- Long-term conditions
- Complexity
- Multi-morbidity
- Emerging disease
- Climate change

It's IT, Jim, but not as we know it, reports **Terence Stephenson**

Captain's log. Stardate May 2013

0830-0930: Consultant led handover as per Francis.¹ The cases are projected by the trainee, Dr McCoy, on to the screen of the NHS Enterprise. Mr Chekov says, “Let's just take a quick look at the chest x ray.” Bones has to come out of the current program, decline several on-screen queries, open a new program, and re-enter his username and password—only to be told that the x ray software won't open unless he begins again and closes the word processing program. Three minutes have elapsed, and we have 60 minutes to discuss 20 cases. We give up, noting the excellent radiologist's report but missing a valuable teaching opportunity. Thank goodness we didn't have to access anything as complicated as the tricorder or switch the phasers to stun.

0930: Consultant led ward round² starts on ward A. The first patient has sickle cell disease and a fever and has been seen by another NHS hospital more than a year ago. 0945: The general practitioner and St

Robots to hasten the demise of grumpy doctors

Eric Topol, who this week published a report for the Department of Health on adapting NHS staff to the rise of digital technology, argues that automation of diagnosis will mean that routine care will no longer need a doctor at all as nurses or even receptionists equipped with computers can do just as well.

“We are heading for a global workforce crisis in healthcare. It’s estimated that the world will need an extra 18m health workers by 2030 as the population grows and ages. In the short term the UK is in danger of making a bad situation worse.”

Standardised data can make workflow more efficient (ie drudgery):

- Appointments
- MDT
- Triage eg of scans
- Standard measurements
- Semi-automated reporting
- QA
- Informatics

Better use of standardized data can mitigate the workforce deficit but human doctors and nurses will not be redundant any time soon!

Thank you
